CENCORI

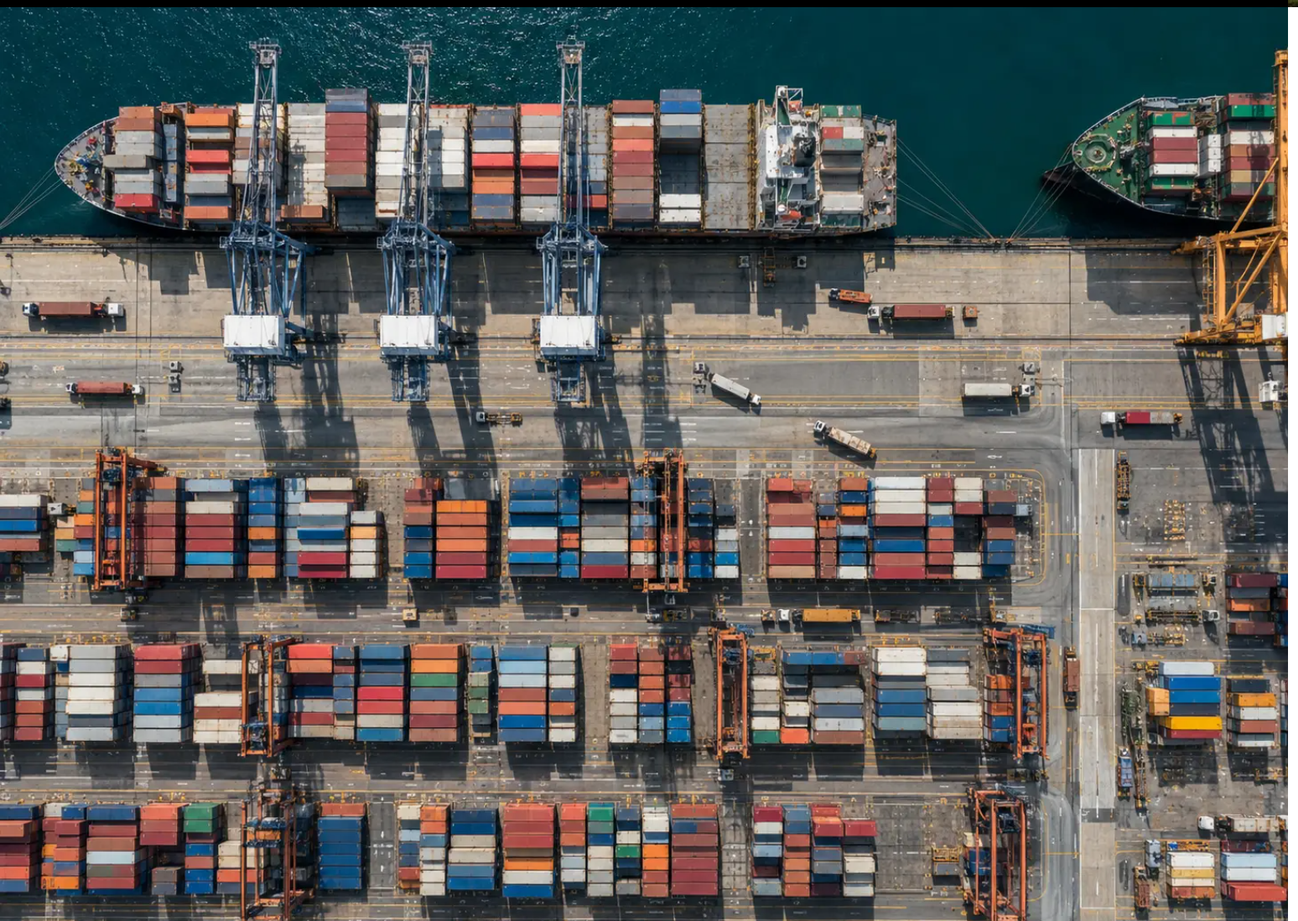

The computing infrastructure AI runs on.

Bola Banjo
Pitch deck
2026

Our thesis

The world is becoming intelligent faster than its infrastructure was designed to support.

AI is the most advanced technology of our generation

It's going to be integrated into every critical industry, every company, every country

Critical industries were never built for AI.

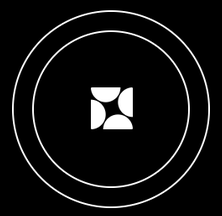

The problem is that the technology is fragmented. It was built to be operated, not think.

The models exist. The infrastructure to put intelligence into critical systems does not.

Our Solution

We make critical systems AI-native.

Connect

Unify machines, sensors, software and operational data.

Computing

Run AI where critical workloads actually happen — cloud, edge or on-premise (sovereign).

Act

Turn real-time data into predictions, decisions and autonomous operations.

We build the network that makes the world's critical systems intelligent.

$1.48T

AI infrastructure spend 2026

$1.98T

projected 2027

$5.2T

AI compute infrastructure required through 2030

how do we make money

Critical Systems

- Long-term enterprise contracts
- Infrastructure licensing
- Deployment and integration fees
- Managed infrastructure contracts
- Support and maintenance agreements
- Custom engineering / systems integration
- Edge infrastructure deployments
- On-premise licensing
- Hardware-software bundled deployments
- Strategic government / industrial contracts

Developer Infrastructure

- Annual platform subscriptions
- Usage-based compute / inference fees
- API usage
- Developer platform subscriptions
- Developer usage-based pricing
- Enterprise developer plans
- Data / orchestration tooling

Sources: Gartner, Worldwide AI Spending Forecast, Sept. 2026; McKinsey, The Cost of Compute, 2025.

AI is scaling faster than its infrastructure can consolidate.

Models are multiplying.

Inference is exploding.

Compute is fragmenting.

AI is moving into everywhere.

$1.48T
AI infrastructure spend in 2026

35% CAGR
AI inference compute demand through 2030

88%
organizational AI adoption

The next infrastructure giant will connect the stack.

Competitive landscape

Company	What they own	Gap Cencori attacks
AWS	Cloud, compute, networking, custom AI chips	Optimized around AWS infrastructure Source ↗
Microsoft Azure	AI infrastructure from silicon to systems	Deep vertical stack, centered on Azure Source ↗
NVIDIA	Chips, systems, networking, AI software	Extremely deep hardware stack, centered on NVIDIA infrastructure Source ↗
Palantir	Enterprise data, models, agents, operations	Strong operational software layer, not neutral infrastructure across the entire compute stack Source ↗
Baseten / Modal	Inference + developer compute	Strong developer infrastructure, but concentrated around inference/compute rather than the whole stack Source ↗

Why We Win.

They own pieces of the stack. Cencori makes the stack one system.

The same infrastructure that serves a 19-year-old building an AI startup can serve an energy company deploying models inside a power facility (obviously, the requirements become radically different).

We don't have to replace the giants.
We aim to be part of the giants.

AI is already running on Cencori.

665
Developers

580+
Active projects & startups

15,000+
SDK downloads every week

504M+

Roadmap

We earn the right to move down the stack.

Today, Cencori developer infrastructure is live.

Phase 1 · Where we are

AI control plane

Intelligent model routing and inference orchestration across providers and endpoints.

Phase 2

Compute abstraction

Deploy inference, agents and AI jobs once. Cencori schedules where they run.

Phase 3

Infrastructure intelligence

Optimize placement, scaling, failover and cost from live workload performance.

Phase 4

Critical systems

Bring the same runtime into private cloud, on-premise and edge environments.

Phase 5

Infrastructure network

Connect GPU clouds, data centers, enterprise clusters and edge nodes into one compute fabric.

Phase 6

Systems & hardware

Purpose-built servers, edge systems and networking informed by workload data.

Phase 7 · Long term

Silicon

Design specialized chips using what the infrastructure network learns about AI workloads.

Bola Banjo

Co-Founder & CEO

Bola Banjo is an engineer, technologist, and deep-tech founder working across modern computing, AI infrastructure, and advanced systems. He is the Founder & CEO of Cencori, where he is building the computing infrastructure for the next generation of intelligent and mission-critical systems. His interests span compute architecture, distributed systems, semiconductors, cloud infrastructure, robotics, energy, and the future of technology in Africa.

Daniel Oreofe

Co-Founder & COO

Daniel is a product builder and growth engineer with 5+ years of experience specializing in scaling internet-native consumer platforms and AI applications. With a deep background in designing tech architecture and user experiences, he drives the operational execution, product velocity, and high-impact GTM loops for Cencori. He focuses on bridging the gap between advanced language models and direct, mass-market consumer acquisition.

9-person total team size

Founders + engineering, product and operations

Next hires

Distributed Systems · AI Infrastructure · Systems Engineering · Hardware · Enterprise

We’re intentionally building a small, exceptional technical team around the founders.

Raising a $3M pre-seed round to build the infrastructure beneath the next generation of applications and critical systems.

Target runway: **18–24 months**

Use of funds

45%	**Engineering & Research** Core infrastructure team, distributed systems, inference, runtime and orchestration.	$1.35M
25%	**Compute & Infrastructure** GPU capacity, cloud, testing environments, networking and deployment infrastructure.	$750K
15%	**Enterprise & Critical Systems** Pilots, integrations, field deployments and strategic customer development.	$450K
10%	**Security & Reliability** Observability, security, compliance, redundancy and production-grade infrastructure.	$300K
5%	**Operations** Legal, finance, recruiting and core company operations.	$150K

Key milestones

- **Productionize the Cencori AI control plane**
  Model routing, observability, reliability, policy controls and workload intelligence.
- **Launch Cencori Inference**
  Run and orchestrate models across multiple providers and deployment environments.
- **Launch Cencori Compute beta**
  Deploy AI workloads without managing the underlying cloud or GPU infrastructure.
- **Multi-environment deployment**
  Cloud, private infrastructure, on-premise and edge.
- **Win flagship enterprise / critical-system deployments**
  Turn the current contract motion into repeatable infrastructure deployments.
- **Scale developer adoption**
  Grow from hundreds to thousands of developers and increase workloads running through Cencori.
- **Build the foundation for the Cencori compute network**
  Multiple compute providers and environments behind one Cencori abstraction.
