

BUSINESS STRATEGY & DEPLOYMENT PLAN

Company Name: Cencori

Author: Executive Management Team

Document Version: 1.0

Date: June 2026

1. Executive Summary

Company Overview

Cencori is an AI Cloud Infrastructure company built to power the digital and economic future of emerging markets. Recognizing that pure software solutions face operational limitations in the absence of robust physical foundations, Cencori is transitioning from an AI software into a vertically integrated, Hardware-Enabled Sovereign Cloud Platform.

The Vision

Our long-term 10-to-15-year objective is to construct a global network of proprietary, green-energy-powered physical data center campuses across Africa, the Americas, Europe, and Asia, to provide the Infrastructure needed for innovation and scale. However, our immediate Phase 1 strategy focuses on a software-defined hardware co-location model designed to dominate the African market, establishing a blueprint for high-margin global replication.

The Immediate Catalyst: CBN 2027

The Central Bank of Nigeria (CBN) data localization mandate requires all financial institutions to host and process local transaction data strictly within domestic borders by January 1, 2027 [guardian.ng]. Cencori is positioned as the primary compliance partner for this regulatory transition, offering an isolated, ultra-low-latency, hybrid CPU-and-GPU infrastructure stack directly out of Lagos.

Problem Statement & Market Opportunity

1. The Capital Flight & The "Cloud Tax"

Nigerian and pan-African enterprises rely heavily on international public clouds (AWS, Azure, GCP). This exposes them to high dollar-denominated egress and bandwidth fees, alongside severe vulnerability to foreign exchange fluctuations.

2. The Compute & Regulatory Chokehold

The 2027 CBN mandate legally prohibits financial institutions from processing sensitive citizen transactions over foreign cloud infrastructure [guardian.ng]. Concurrently, local AI startups, researchers, and enterprise projects are blocked from developing high-performance machine learning models due to the extreme costs and latency of accessing foreign GPUs.

3. The Structural Hardware Reality

Standard data center architectures are optimized purely for sequential CPU processes (like basic web hosting). They lack the highly parallel, high-density GPU infrastructure required to process massive modern AI workloads—such as real-time financial fraud detection, medical diagnostic imaging, and agricultural geodata mapping.

3. Product & Service Ecosystem (The Dual-Engine Framework)

Cencori does not construct physical buildings in Phase 1. Instead, we procure specialized, enterprise-grade server infrastructure and co-locate it within existing Tier III/IV data center facilities in Lagos. Our platform splits into two clear market offerings driven by a single physical hardware stack:

- Cencori Enterprise: A highly secure, isolated computational block dedicated to banks, fintechs, insurance providers, and government portals. It guarantees that standard core operations (transactions, API lookups, account balances) and native analytical AI models remain entirely within the domestic network.
- Cencori Compute: A pay-as-you-go, serverless developer cloud that gives regional AI startups, research labs, and independent engineers direct, affordable access to high-performance enterprise GPUs for model training and application hosting. This is what Cencori's AI cloud is built on. This includes the AI gateway (currently live), Agentic infrastructure, and general AI workload

4. Technical Architecture & Absolute Isolation

To host highly secure enterprise assets alongside public startup applications on the same physical infrastructure racks, Cencori utilizes a hardware-enforced, zero-trust

multi-tenant architecture:

- **Silicon Isolation (NVIDIA MIG & SR-IOV):** We implement NVIDIA Multi-Instance GPU (MIG) technology to slice a single physical graphics processor into distinct hardware slots, ensuring complete memory and execution isolation [nvidia.com]. Single Root I/O Virtualization (SR-IOV) partitions the CPU and networking pipelines, making it physically impossible for a tenant's software to read or access adjacent enterprise workflows.
- **Data Separation:** Enterprise data is allocated to physical NVMe drives encrypted via on-silicon AES-256 keys managed exclusively by the client. Startup workloads operate in a virtualized, ephemeral pool that systematically clears all local memory caches upon processing completion.
- **Network Perimeter Isolation:** Bank transactions bypass the public internet entirely, communicating through secure Cross-Connect fiber cables directly into isolated Virtual Private Clouds (VPCs). Developer applications are pushed to an outbound-only public subnet, fully blind to the core database routers.

5. Market Positioning Strategy

Competitive Differentiators Against Global Competitors (e.g., AWS)

- **Regulatory Shield:** Absolute guarantee of local data residency, removing compliance risks for institutions preparing for the 2027 deadline [guardian.ng].
- **Economic Predictability:** Elimination of foreign exchange volatility via native local currency (Naira) predictable pricing structures.
- **Performance Latency:** Local server placement cuts network routing round-trips from ~120ms (to Europe or the US) down to sub-10ms locally.

Positioning Matrix Across Verticals

Our market entry relies on a Horizontal Multi-Industry Spillover blueprint. Conquering the highly scrutinized financial sector validates our compliance and performance capabilities, clearing a path into adjacent high-value industries:

Target Vertical	Value Proposition	Use Cases Running on the Infrastructure
Finance (<i>Anchor</i>)	Complete Regulatory Sovereignty & Naira Predictability	Transaction Ledgers, Account Settlement, Live Fraud Scoring
Healthcare (<i>Horizon 1</i>)	Legally Compliant, Patient Data Residency Protection	X-Ray & MRI Machine Learning Diagnostics, Health Records
Agriculture (<i>Horizon 2</i>)	Edge Data Processing & Low-Bandwidth Aggregation	Drone/Satellite Mapping, Soil Sensor Logging, Yield Predictions
Government (<i>Horizon 3</i>)	National Security & Identity Infrastructure Control	NIN/BVN Registry Management, Municipal AI Automation

6. Financial Plan & Scalability Model (Phase 1)

Phase 1 Estimated Deployment Cost (Lagos Node)

Expense Tier	Component Breakdown	Rough Capital Required (USD)
Hardware Procurement	NVIDIA Enterprise GPUs, Multi-Core CPUs, Low-Latency NVMe	\$2,000,000
Logistics & Compliance	Global Freight Shipping, Port Clearing, Import Duties	\$400,000
Facility Operations	Tier III+ Co-location Racks, High-Density Power, Interconnects	\$350,000
Core Software Engineering	Kernel Hardening, Custom Hypervisors, Operating Runway	\$1,200,000
Capital Buffer	Foreign Exchange Protection & Hardware Spare Inventories	\$450,000
TOTAL INITIAL CAPEX/OPEX	Estimated Funding Requirement to Go Live	~\$4,400,000

Dual-Engine Revenue Structure

- Enterprise Tier (The Anchor): Contractual B2B models characterized by an upfront implementation fee (\$25,000) followed by a recurring monthly infrastructure subscription (\$15,000 - \$30,000 per month). This model provides predictable, recurring contract values that completely absorb local hardware CapEx and Opex within 18–24 months.
- Startup & Developer Tier (The Volume): Pay-as-you-go billing calculated per second of compute or per million API gateway transactions. This tier features low entry barriers, driving volume, user adoption, and long-tail transaction scale.

The Self-Funding Flywheel

By acquiring 3 to 5 Tier-1 banking clients in year one, their long-term enterprise subscription revenues fully finance the local server overhead. This enables Cencori to lower the price point of raw, on-demand compute for hundreds of local AI startups, accelerating developer adoption and building a captive, multi-industry customer ecosystem.

7. Operational Scale & 15+ Year Horizon Map

Phase 1 establishes a standardized, self-contained unit of execution. Once the Lagos configuration is fully optimized and profitable, Cencori scales via horizontal global expansion:

- Years 1–3 (Domestic Dominance): Solidifying the Lagos footprint, securing the regional banking ecosystem, and achieving cash flow independence ahead of the 2027 regulatory shift.
- Years 3–7 (Pan-African Sovereign Mesh): Exporting the exact hardware-and-software bundle into core connectivity points across Abuja, Johannesburg, Nairobi, Cairo, and Accra to meet localized African data laws.
- Years 7–10 (The Global Cloud Leap): Deploying infrastructure stacks into global networking junctions—such as New York, Frankfurt, and Tokyo—competing on pricing efficiency and decentralized developer orchestration layers.
- Years 10–15+ (The Physical Grid): Transitioning from co-location tenants to sovereign data landowners by funding, building, and operating our own multi-megawatt data center campuses across emerging markets.

Cencori does not view the physical hardware as a simple asset; we view it as a vessel. By decoupling the underlying software orchestration layer from the physical concrete, Cencori is positioned to deploy its infrastructure anywhere in the world, defining the future of cloud computing for generations to come.
